

Vigilon Hybrid Network Card

Hybrid Network allows planned upgrade of old, non compliant systems with maximum efficiency and minimum disruption.

The new Hybrid Network for Vigilon is designed to allow a phased upgrade of older networks. New EN54 certified Vigilon Panels can be installed alongside obsolete non-EN54 networks with fully integrated cause and effect across the networks. As part of a planned upgrade this provides a low disruption option for system upgrades.

KEY FEATURES

- EN54 - 2 certified panels operate on the same network with all critical events and control options across the network
- Simple conversion of existing panel configuration with special conversion tool
- Hybrid card compatible with replacement EN54 panel reducing waste
- Hybrid network operates across small and larger multi-domain networks

Network Upgrade Process

STEP 1

Convert network to 'Vigilon Hybrid' by installing Hybrid network card in each of the old panels.

- Quick and easy exchange without any need to change panel configuration

STEP 2

Update any head-end management system and Terminal Nodes.

For example:

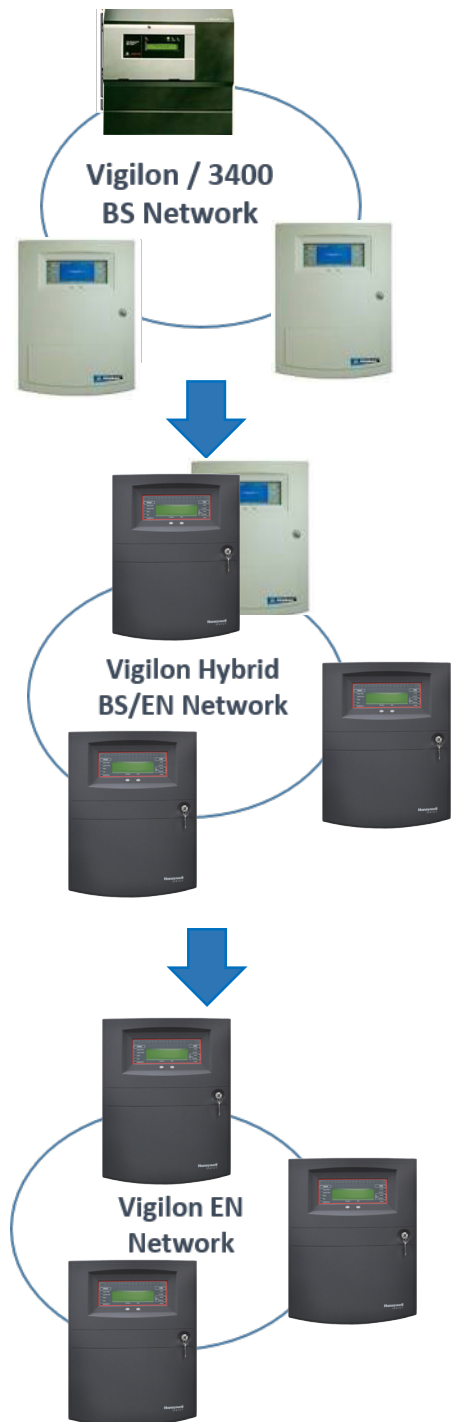

- Swap Winmag from BS to EN
- Upgrade Supervisor 3 to Winmag
- Old Terminal Nodes to be replaced with current versions

STEP 3

Replace old panels and devices with new EN54 certified product one panel at a time

- Upgrade in a timeframe and budget to suit end-user
- Use configuration conversion tool to convert cause and effect from old to new panels
- System continues to function as a fully secure network
- Fully compliant EN54 network once all panels are replaced

For more detailed guidance on how to plan and manage the upgrade process, please refer to the 'Hybrid Network Card Data and Installation Guide' which can be found on Gent Expert.

Hybrid networks are intended to ease the upgrade of old networks. The system will only be fully compliant once all panels are upgraded. Hybrid networks should be used as part of a phased upgrade program which should last no longer than 3 years
